A Global Visioconference Network for Otolaryngology

The aim of the LION is to create a permanent interactive worldwide high speed network for Continuing Education in Otolaryngology and to promote distance learning using modern videoconferencing technologies.

*This advanced
medical network
technology provides the
data communications
infrastructure essential
to the development
of the global
otolaryngological
community.*

The annual program will offer participants around the world direct and interactive access to international experts in the various fields of otolaryngology. The program is currently focused on Otology-Neurotology but it will grow in the future to include other fields of ENT. Such multicenter sessions will emulate the advantages of international meetings by allowing exchanges of ideas and experiences. The LION project will provide a focus for training as well as an enhanced professional experience.

The concept of a global network is greatly enhanced by a constantly accessible highly interactive videoconferencing system. This allows for high quality image and sound transmission. While the formal conference and meeting remain the staple of organized CME worldwide the LION offers new trends in this field enhancing distance learning. By improving cost efficiency and decreasing flight-related CO2 emission the LION will be of dual benefit to otolaryngologists worldwide, to the environment by respecting the planet and natural resources.

Annual program of Continuing Education in Otolaryngology

The LION is a training in-country project conducted with international partners. LION's program will include multiple annual scientific events and interactive training sessions enhancing the continuous exchange of ideas and sharing of clinical experience from among the world.
